

Personal Duress System

The personal duress system is ideal for school class rooms, receptionist desk, shopping mall store fronts or any permanent location requiring immediate response to duress conditions. Using wireless technology, this inexpensive system provides a remarkable level of protection by instantaneously notifying security personnel of a duress condition. Notification is by natural voice messages transmitted over existing two-way radios. Messages are clear and concise, describing the exact location of the alarm. Because radios are used for notification, anyone within range of the radio system will hear the call for help, even while patrolling in a vehicle. Each message is custom recorded on-site allowing for a high level of accuracy in describing the location. Many radio systems can easily transmit 5-miles and beyond creating a reliable system for even the largest facilities.

Interactive graphical maps provide visual displays, while simultaneously recording the time, date and location of the alarm.

Because the "Personal Duress System" is one part of "Global Facility Manager's" suite of solutions, this same system can be expanded to provide Access Control, Intrusion Detection, CCTV, Intercom, Electronic Signs, lighting, HVAC control as well as many other applications.
